Digital Retinal Imaging

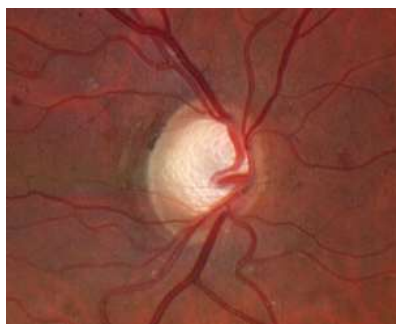

Because Dr. Schauer, Dr. Aberle, and Dr. Dyke believe that the newest technology provides the best eyecare, we will obtain a digital retinal image during the comprehensive eye examination. We refer to this imaging as the **EyeScreen** photo. It is **only \$30** and it is an easy procedure that captures a high-resolution image of the retina inside the eye using the Zeiss Clarus HD fundus camera.

Most of our patients feel the Eyescreen photograph is an invaluable and irreplaceable tool. Retinal problems such as **macular degeneration**, **glaucoma**, and **diabetic retinopathy** can be detected with digital retinal imaging, along with many signs of systemic health conditions such as **high blood pressure**, **high cholesterol**, and **cancer**.

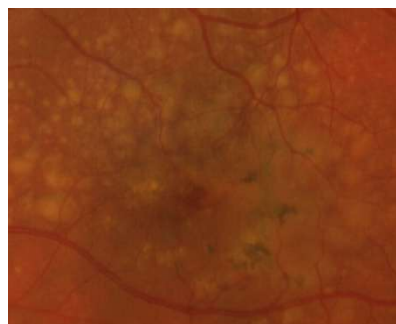

A picture is truly worth a thousand words! The photograph compliments the doctor's retinal examination to better assist viewing the internal ocular anatomy. This image allows your doctor to take the *best care* of your eyes for a lifetime.

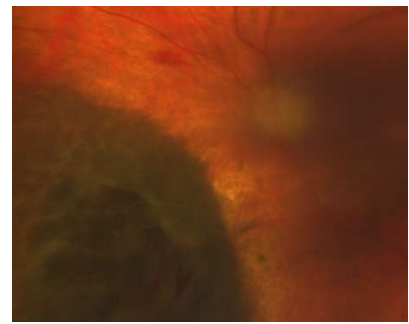

Actual patient photo examples:

Glaucoma

Macular Degeneration

Malignant Melanoma
